

PolicyWise General Claims Guide - Synthetic Reference Document

Document Code: PW-CL-2026-01

Important: This is a fictional, synthetic document created only for software development, RAG testing, demonstrations, and training. It is not a real insurance contract.

1. Purpose

This guide explains a generic claim workflow for the synthetic PolicyWise dataset. Product-specific policy wording always takes priority when a product document states a different requirement.

2. Step 1 - Notify the Insurer

Notify the insurer or assistance provider as soon as reasonably possible after an insured event. Emergency situations should be addressed safely before administrative steps are completed.

Provide the policy number, insured person's name, date of event, type of loss, contact details, and a short description of what happened.

3. Step 2 - Gather Documents

Collect documents relevant to the claim. Depending on claim type, these may include claim forms, invoices, receipts, medical records, discharge summaries, police reports, photographs, travel records, death certificates, or vehicle documents.

Only documents relevant to the particular claim should be requested or submitted.

4. Step 3 - Submit the Claim

Submit the completed claim form and supporting documents through the permitted claim channel. Retain copies of submitted documents and any claim reference number.

Incomplete documentation can delay assessment because the insurer may request missing information.

5. Step 4 - Assessment

The insurer reviews whether the event occurred during the policy period, whether the claimed event is covered, whether exclusions or waiting periods apply, and whether applicable limits or deductibles affect the payable amount.

A claim being registered does not mean that it has been approved.

6. Step 5 - Decision and Settlement

If a claim is accepted, settlement is made according to the applicable policy terms and approved amount. If a claim is declined or partially settled, the claimant should receive the reason according to the applicable process.

Questions about a decision should be handled through the insurer's grievance or review procedure.

7. RAG Testing Note

This document intentionally contains generic claims information. A retrieval system should prefer a product-specific policy when the user's question names a product or asks about a product-specific deadline.
